## DETAILED ACTION

### *Specification*

The specification is objected to as failing to provide proper antecedent basis for the claimed subject matter. See 37 CFR 1.75(d)(1) and MPEP § 608.01(o). Correction of the following is required: the bolus delivery component in **parallel communication** with the valve in claim 1.

### *Claim Rejections - 35 USC § 102*

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 11 and 12 are rejected under 35 U.S.C. 102(b) as being anticipated by Dietrich et al U.S. Pat. No. 3,941,126.

Dietrich discloses a flow control device comprising: a reservoir (11) and a flow control assembly (10), the flow control assembly including a valve (37') in fluid communication with the reservoir and a restrictor (37) in fluid communication with the valve; and a bolus delivery component ((38' inlet valve), (46 accumulator) and (65 outlet valve)) the bolus delivery device in parallel communication with the flow control assembly. Note: applicant has not given any structure to restrictor. Therefore, it is the examiner's position that the restrictor is a mere tube since anything that affects the flow of fluid can be regarded as a restrictor.

Further, an accumulator is nothing more than a mere reservoir or container. As to claim 12, (see above rejection); as to claim 13.

***Allowable Subject Matter***

Claim 1-10 and 13 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The following is a statement of reasons for the indication of allowable subject matter:  
Idriss discloses an flow control device substantially as claimed at the time the invention was made except for the bolus delivery component in parallel communication with the valve.  
Dietrich et al discloses a flow control device substantially as claimed at the time the invention was made except for a control module for generating a control signal to the valve and controlling the valve.

***Conclusion***

Any inquiry concerning this communication or earlier communication from the examiner should be directed to Kevin C. Sirmons whose telephone number is (703) 306-5410. The examiner can normally be reached on Monday - Thursday from 6:30 am to 4:00 pm. The examiner can also be reached on alternate Fridays.
